Not illustrated. 1878 Excerpt: .string, entering the first sphere at A, and leaving it at C, then entering the second sphere at D and leaving it at F; so that ABC is a diameter of the first sphere, and DEF a diameter of the second sphere. The string rises vertically at A and at F. The tension of the string is equal to the weight of one sphere. For we might suppose the two spheres and the part of the string from A to F to become rigid. Then the two vertical tensions would support the weight of the two spheres; and thus the tension would be equal to the weight of one sphere. Now consider the forces which act on one sphere, say that which has its centre at B. These are its weight, say  $W$ , vertically downwards at B, a tension equal to  $W$  vertically upwards at A, a tension at C along CD equal to  $J$ , and the resistance of the other sphere, say  $R$ , along EB. Resolve the forces horizontally and vertically, as in Art. 93. Hence we see that the force along EB must be equal and parallel to that along CD: thus  $R=W$ . 68. Consider one rod, for instance AB. This is acted on by some vertical force at A, by its own weight, and by a force at B; the last force *tlieu* must be vertical for the other two forces are. Thus the mutual action between the rods at B must be...
